Project Tag Database Manager

The Project Tag Database Manager (PTDBM) simplifies project management by consolidating tag name definitions. Once defined, tags are automatically available to all NetSuite applications. The Project Tag Database Manager is also used to configure devices for NetSuite applications.

Tags can be added to the Project Tag Database in several ways. They can be typed directly into the Tags page of the Project Tag Database Manager. They can be imported from a Tag Table File created with a spreadsheet application. Tags will be added if you assign tag names to objects in NetArrays, and then download the project to a target device or simulator. Tags will also be added if an upload command from a target device is performed.

This setup example demonstrates how to 1) create tags in an excel spreadsheet, 2) define the alarming parameters, 3) import tag list into the PTDBM, 4) import tag list from PTDB into the NetArrays projects, 5) assign imported tags to I/O card channels, and 6) import the tag list into the RTPADA.

Defining Tags in Excel

There is a tag table file template installed during the RTP NetSuite software installation for defining tags in an excel spreadsheet. The default location of the file is C:\RTP NetSuite\PTDB\Import_Table.xls.

Note: When entering a tag name, the following rules apply:

- No more than 29 characters are allowed for a tag name.
- Blank spaces, dashes, hyphens, commas, asterisks (*), pound symbols (#), single quotation mark ('), equal signs (=), square brackets ([]), and parentheses () are not allowed in Tag names.
- Tag names must be unique throughout a project. If a database contains multiple projects, tag names should be unique across all projects. This rule does not apply to Peer variables and variables that are strictly used within a NetArrays project.

Tag Table File Editing

The Import_Table.xls file may be modified to define all user tags. Upon completion, it should be saved as a comma separated variable (.csv) file. This file is used for importing tag names into the Project Tag Database and RTPADA.

The following creates a list of I/O channel tags, which will be imported and assigned to a 32 channel analog input card in Rack 00 slot 4 of a 3000Q/00-13 quad system.

- Open the Import_Table.xls
- See the Netsuite User Manual File Import and Export function section for a description of each field.
- Enter LIC_100 in cell A2 and use the auto-fill to generate tags LIC_101 thru LIC_131.
- Enter the additional alarming specifications and comments for the tags generated as shown in Figure 2:

Note 1- the yellow highlighted cells are fields to define the alarm configuration. Note 2- the first line must contain the column header names as shown below in Figure 1. All of these column header names are in the default Excel spreadsheet.

Importing Tag Table List

The tag table list comma separated (.csv) file created is imported into the PTDBM by performing the following steps:

- Execute the PTDBM application
- Select Database, Tags, Import
- Open the Import_Table_1.csv file

Importing Tags Into NetArrays

The list of tags in the PTDBM is accessible for importing into the NetArrays project.

- Execute NetArrays
- Select <u>Tags</u>, Get From PTDB...
- Select tags LIC_100 through LIC_131 then click Import Tags

The tags imported into the project may be viewed in the Tags and I/O array browser.

• Click <u>Tags</u>, Tags and I/O Arrays Browser...

Figure 5

The screw in the up position \square , Domain and IoArray type "N/A" indicates the imported tags have not been assigned.

Assigning Imported Tags To I/O

The IO configurator allows the user to select the type of node CPU configuration, chassis type and I/O cards for the individual slots. The user may auto-assign tags to the channels of the IO Cards or select tags from the list of unassigned tags as shown above.

- Close the Tags and IO array browser
- Click the IO Configuration button on the main toolbar
- Select and drag the 3000Q/00-13 CPU node from the list on the right pane, drop into the empty Node=Empty box

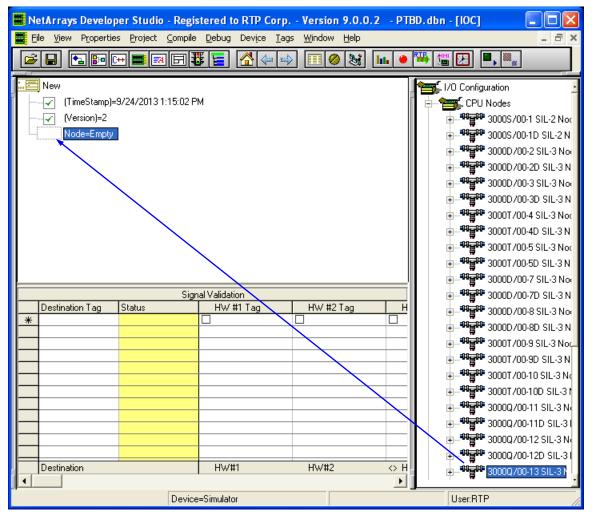

Figure 6

- Open the Node and Rack objects in I/O by clicking plus.
- Open the box RTP Analog Cards in the I/O Configuration by clicking plus.
- Drag and drop the 3115 32-Channel AI card into slot 4.
- The Auto Tag Generation dialog box will appear as shown below:

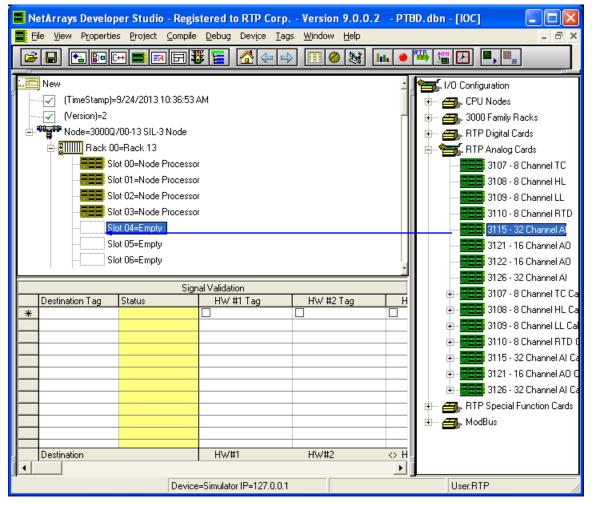

Figure 7
